100A Current Sensor

For the electronic measurement of currents:
DC, AC, pulsed, mixed with a galvanic Isolation
between the primary circuit (high power) and the
secondary circuit (electronic circuit)

Date: 08.03.2017

Customer: Standard type

Customers Part no:

Page 1 of 4

Description

- Closed loop (compensation)
Current Sensor with magnetic probe
- Printed circuit board mounting
- Casing and materials UL-listed

Characteristics

- excellent accuracy
- very low offset current
- very low temperature dependency and offset current drift
- very low hysteresis of offset current
- short response time
- wide frequency bandwidth
- compact design
- reduced offset ripple

Applications

Mainly used for stationary operation in industrial applications:

- Solar inverter

Other instructions:

- Current direction: A positive output voltage vs. V_{REF} appears at point V_{OUT} , if primary current flows in direction of the arrow.
- Constructed, manufactured and tested in accordance with IEC 61800-5-1:2007.
- Temperature of the primary conductor should not exceed 105°C.
- Housing and bobbin material UL-listed: Flammability class 94V-0.
- Further standards: UL 508, file E317483, category NMTR2 / NMTR8

Explanation of several terms used in the tables:

V_{0t} Long term drift of V_O after 100 temperature cycles in the range -40°C to 85°C .

t_r Response time, measured as a delay time at $I_P = 0.9 * I_{PN}$ between a rectangular primary current and the output current or voltage.

t_{ra} Reaction time, measured as a delay time at $I_P = 0.1 * I_{PN}$ between a rectangular primary current and the output current or voltage.

$X_{ges}(I_{PN})$ The sum of all possible errors over the temperature range by measuring a current I_{PN} :

$$X_{ges}(I_{PN}) = 100 * \left| \frac{V_{OUT}(I_{PN}) - 2.5V}{0.625V} - 1 \right| \%$$

X Permissible measurement error in the final inspection at RT, defined by

$$X = 100 * \left| \frac{V_{OUT}(I_{PN}) - V_{OUT}(0)}{0.625V} - 1 \right| \%$$

ΔX_{θ} $\Delta X_{\theta} = X_{\theta max} - X_{\theta min}$

ϵ_L Linearity fault defined by: $\epsilon_L = 100 * \left| \frac{I_P}{I_{PN}} - \frac{V_{OUT}(I_P) - V_{OUT}(0)}{V_{OUT}(I_{PN}) - V_{OUT}(0)} \right| \%$

Where I_P is any input DC current and V_{OUT} the corresponding output term. ($V_O = 0$).
